

Project Workflow: Week 2

Phase: Requirement Analysis and System Design

1.Objective

The primary objective of Week 2 was to analyze the system requirements and establish the fundamental design of the Escape Room Puzzle Game. This phase focused on identifying the required functionalities, defining the player's objectives, and preparing the overall system structure for future development.

2.Detailed Task Breakdown

- **Functional Requirement Analysis:**

Identified the essential functionalities of the game, including room navigation, puzzle interaction, inventory management, and game progression mechanisms.

- **Player Objective Definition:**

Defined the player's primary goal, which is to solve puzzles, collect clues, and escape from the room by completing all required challenges.

- **Win and Failure Conditions:**

Established the success and failure conditions of the game to determine how players achieve victory or lose the game.

- **System Architecture Planning:**

Designed the overall structure of the application, including the interaction between game components such as rooms, puzzles, inventory, and player actions.

- **Module Identification:**

Separated the system into individual modules to simplify development and improve maintainability.

3. Deliverables

- ☐ Software Requirement Specification (SRS) document.
- ☐ Functional and non-functional requirement list.
- ☐ Player objective and game rules documentation.
- ☐ Module identification report.

4. Tools & Resources

Development Environment:

- Java JDK 11+
- IntelliJ IDEA / VS Code

Reference Materials:

- ☐ **Java Documentation**
- ☐ **Game Design Principles**
- ☐ **Object-Oriented Programming Concepts**
- ☐ **Escape Room Game Design Resources**
